

Name: Anh Pham
Student number: 050357871
Course: COMP.CS.300: Data Structures and Algorithms
Project 1

Table: Asymptotic performance of commands

Command	Asymptotic performance and explanation
place_count	$\Theta(1)$: Calculate vector's size
clear_all	$\Theta(n)$: n is number of places/areas
all_places	$\Theta(n)$: iterate through all elements of vector
add_place ID 'Name' type (x,y)	$O(\log n)$: Add new element to 2 multimaps and 1 unordered map
place_name_type ID	$\Theta(1)$: Search unordered_map with key
place_coord ID	$\Theta(1)$: Search unordered_map with key
places_alphabetically	$\Theta(n)$: Iterate through a multimap
places_coord_order	$\Theta(n \log n)$: Sort a vector using <code>std::sort</code>
find_places_name name	$O(\log n)$ then $\log n$: Find positions using <code>equal_range()</code> , and add to a vector
find_places_type type	$O(n)$: Search an unordered_map $O(\log 7)$, then copy elements from an unordered_set to a vector
change_place_name ID newname	$O(\log n)$: Search, erase, add element in map
change_place_coord ID (x,y)	$O(1)$: Search and modify value in unordered_map
add_area ID Name Coord1 Coord2	$O(1)$: Add new to unordered_map
area_name ID	$O(1)$: Search unordered_map with key
area_coords ID	$O(1)$: Search unordered_map with key
all_areas	$\Theta(n)$: Iterate through unordered_map
add_subarea_to_area AreaID AreaID	$O(1)$: Search and assign in unordered_map
subarea_in_areas AreaID	$O(k)$ (k: number of parent areas) Continuously looking for parent area using pointer
creation_finished	$\Theta(1)$: Do nothing

all_Subareas_in_area <i>AreaID</i>	$O(m^k)$ (m: number of direct subareas; the last subarea of areaid is the kth area): Area pointer continuously search if its parent area exists, and recursively with other direct subareas
places_closest_to <i>Coord [type]</i>	$O(n)$ then $O(m)$ (m: number of places have the same type): partition a vector and sort a constant amount
remove_place <i>ID</i>	$O(\log n)$: Delete key in unordered_map: $O(1)$, value in multimap: $O(\log n)$, element in unordered_set: $O(1)$
common_area_of_subareas <i>AreaID AreaID</i>	$\Theta(\min(n_1, n_2))$ (n: number of common parent areas): search for the first same pointer

Data structures for place and area:

```
struct Place{
    PlaceID
    Name
    PlaceType
    Coord
    Id_TypeCoord_ptr: Pointer that points to a place data
    (with id, type and coord)
}

struct Area{
    AreaID
    Name
    vector areaboundary: contains all coordinates of an area
    shared_ptr parent area: point to its parent area
    unordered_map subareas: each element in map is a subarea,
    with AreaID as key and a pointer points to Area as value
}
```

Data structures to store places and areas' data:

```
multimap placename_to_placeid: name as key, id as value
unordered_map placetype_to_placeid: type as key,
unordered_set of ids as value
unordered_map placeid_to_data: id as key, pointer that
points to place as value
vector placeid_to_placetypecoord: contains
Id_TypeCoord_ptr mentioned above

unordered_map areaid_to_data: id as key, pointer that
points to an area as value
```

Reasons for choosing above data structures:

unordered_map(s) for place and area let me access Place or Area with constant time.

multimap placename_to_place_id increases performance on find_places_name command. This affects add_place performance a little, but it is balanced between commands.

unordered_map placetype_to_place_id allows command find_place_type cost $O(n)$ for copying, and remove_place costs $O(1)$

vector placeid_to_placetypecoord is always sorted for better adding, searching, and removing performance.

Testing output

Testing file output using command *testread* "-in.txt" "-out.txt" and other commands that I tested myself, compared to the expected output, there is no error.

Testing performance

Some commands have better performance while others have worse than expected. Timeout when testing remove_place and sorting commands.

```
> read "perfctest-all.txt"
** Commands from 'perfctest-all.txt'
> # Read performance tests of all operations
> read "perfctest-compulsory.txt"
** Commands from 'perfctest-compulsory.txt'
> # Read performance tests of compulsory operations
> read "perfctest-access.txt"
** Commands from 'perfctest-access.txt'
> # Test the performance of stop_name/stop_coord/region_name
> perfctest place_name_type;place_coord;area_name 20 5000
10;30;100;300;1000;3000;10000;30000;100000;300000;1000000
Timeout for each N is 20 sec.
For each N perform 5000 random command(s) from:
place_name_type place_coord area_name
```
